It has been over a year since our latest release, therefore there are many changes in this update. During this time we were working hard to bring you the new and updated Lakka. Thanks to our nightly build infrastructure many of you helped us test this release and gave us precious feedback.

As usual the release includes the latest RetroArch version at the time, which is currently 1.9.3, as well as updates to all the supported cores to the most recent versions, even some new cores were added. This time we recommend doing a clean install to avoid any incompatibility issues, as significant changes to the underlaying operating system and RetroArch were made. The size of the boot partition was increased to 2 GB, which is not compatible with previous installations.
GNU Linux
