How use Kali Linux [9]
Kali is a security distro of Linux derived from Debian. The main objective of Kali is to carry out computer forensics and innovative penetration testing. The OS was developed due to backtrack rewriting by the two developers (Mati Aharoni for backtrack and Devon Kearns of offensive security).

Security administrators mainly use it to identify security breaches. Kali has several pre-configured tools that enhance its security protection in the operating system. Subsequently, Network Administrators can use the OS to maintain an efficient and secure web framework. This is because the OS supports network auditing.

Network architects also use Kali to design network environments since the OS assures proper configuration, making their work easier. Other people who can also use this system include chief information security officers, forensic engineers, computer enthusiasts, and hackers.
