Internet Relay Chat is a client and a protocol for real-time Internet text messaging and synchronous conferencing. Users can connect with an IRC client to a global network of IRC servers for one-on-one or group chat. Some may consider IRC an old-fashioned way of communication, but it still has many users in the development community.

IRC is still under constant development, with IRCv3 promising some advanced client features such as instant notifications, improved security, and standard features like group communication in forums and channels, one-on-one communication via chat or private message, and data transfers via Direct Client-to-Client.

For file transfers in IRC, users can create file servers to share files using customized scripts or bots for their IRC client. I use IRC primarily to engage with the Linux community. You can share or engage directly with users or developers of applications and distros.
