In a world where some question the code-share channels of open source communities and the use of components that may (or indeed may not) bring into question their provenance, prowess and performance? CloudLinux is an organisation on a mission to increase security, stability and availability of Linux servers and devices.

Headquartered in Palo Alto, CloudLinux Inc. develops a hardened Linux distribution, Linux kernel live security patching, extended support options for Linux and web server security software.

The organisation this year detailed what it calls TuxCare services, with the Tux reference obviously being the Linux penguin.
