Raspberry Pi OS now has SATA support built into the kernel. Before you rush to tear the hard drive from your PC and hook it up to your Pi, there's a catch: you'll need a Compute Module 4 instead of the standard 4B or 400 models. And for now you can't boot from it. YouTuber and Jeff Geerling, who is responsible in part for the addition, has an insightful blog post on the matter, and a video essay embedded below.
