X-Road is a decentralised data-exchange layer that provides a secure and unified way to exchange data between organisations. X-Road is published as open source under the MIT licence, so it is free for any individual or organisation. Originally, X-Road was developed in Estonia twenty years ago, in December this year it will be its 20th birthday. Since then, X-Road has spread all over the world. In Europe, Estonia, Finland and Iceland are using X-Road, whereas outside of Europe we have 20 additional countries using it. Currently, X-Road has been deployed in South America (e.g. Brazil, Mexico, Argentina) as well as in Asia (e.g. Vietnam, Japan, Cambodia). During the last 20 years X-Road has really grown from an Estonian solution to a truly international open source solution and open source community.
