More than two years in the works, Debian GNU/Linux 11 ?Bullseye? is here with lots of updated components and new GNU/Linux technologies to keep up with the times. It’s powered by the Linux 5.10 LTS kernel series, which will be supported for the next five years, until December 2026, and offers improved hardware support.

Software-wise, all supported desktop environments have been updated to newer versions, including GNOME 3.38,
KDE Plasma 5.20, Xfce 4.16, LXQt 0.16, LXDE 11, and MATE 1.24. Under the hood, Debian GNU/Linux 11 uses the GCC 10.2 system compiler, as well as GNU C Library 2.31, LLVM 11.0.1, and other technologies.
