We have 2 versions for experienced users to try. These iso files default to using SysVinit.

antiX-21-b2-x64-full and antiX-21-b2-386-full are beta quality releases for experienced testers of antiX to test and provide feedback before final release.
Do not use this as your main OS, though it *might* be possible to upgrade to final (no promises).

* customized antiX 4.9.0-279 and 5.10.57 kernels on the 64 bit live iso. Please try both in your tests.
* customized antiX 4.9.0-279-486-non-pae kernel on the 32 bit live iso. (pae versions available in the repos)
* grub/UEFI live boot changes. Select live boot options (persistence, etc?) from the boot menu and sub menus rather than using the previous console menus. Please check localisation.
* New installer partition selection area, including some lvm support if lvm volume exists.
* no virtualbox-guest packages so best to test on real hardware ? live, frugal or installed.
* added mesa vulkan drivers
* improved localisation of apps and live system
