The Home Assistant project has opened pre-orders on an open-spec, \$149 ?Home Assistant Amber? system based on an RPI CM4 with GbE, 3x USB, ZigBee, and M.2 M-key. \$99 kit versions without the CM4 include a PoE model.

Last year, the Home Assistant project celebrated the release of Home Assistant 2020.12 by offering its popular, Linux/Python-based home automation software pre-installed on a Odroid-N2+ Home Assistant Blue bundle with enclosure. Now, to celebrate its 8th birthday, the project has gone to Crowd Supply to launch its own Home Assistant Amber development board with enclosure built around a Raspberry Pi Compute Module 4.
