- [Install LEMP Stack \(Nginx, PHP and MariaDB\) on Debian 11](#) [2]

A LEMP Stack is a set of open-source software and frameworks or libraries that are used to host web applications on the internet. A stack consists of Linux operating system, Nginx web server, MariaDB/MySQL database server, and PHP language. A LEMP has good community support and is used in many highly scaled web applications around the globe.

In this post, we will show you how to install the LEMP stack on Debian 11.

- [Linux: Install automatic package updates for Debian, Ubuntu, Raspi OS & Co.](#) [3]

- [Organize your Magic: The Gathering decks with Magic Assistant | Opensource.com](#) [4]

It remains popular today because of its great flexibility. With more than 25,000 unique cards published over nearly three decades, there are enough cards for players to build hundreds of different decks for surprisingly unique gameplay experiences.

Along with this flexibility, however, there comes a cost: many Magic: The Gathering players collect lots of cards so they can construct lots of different decks, which in turn lets them focus on different win conditions and try out different strategies.

It can be quite a job to keep track of 1,000 cards when you only need 60 to 100 for a deck, but the open source application Magic Assistant makes managing your Magic collection easy.

- [Kubernetes admission control with validating webhooks | Red Hat Developer](#) [5]

This article describes how to write, configure, and install a simple Kubernetes validating admission webhook. The webhook intercepts and validates PrometheusRule object creation requests to prevent users from creating rules with invalid fields.

A key benefit of this approach is that your clusters will only contain prevalidated user-defined rules, resulting in uncluttered configuration across environments. Additionally, imagine there is an external alerting system that leverages fields in these customer-provided rules to make alerting decisions. It is important to ensure the rules are properly formatted, so the alerts are forwarded to the appropriate teams with the correct information.

The example here is quite simple, but it can serve as a starting point to cleaner Prometheus installations with minimal errors.

- [GNU Linux Debian ? how to create RAID10 \(mdadm software raid, basic benchmarks 4x Hitachi HGST Ultrastar 7K4000\)](#) [6]

- [How To Install phpBB on Ubuntu 20.04 LTS - idroot](#) [7]

In this tutorial, we will show you how to install phpBB on Ubuntu 20.04 LTS. For those of you who didn't know, phpBB is an open-source bulletin board package written in PHP. PhpBB can instantly establish a dedicated space for people to gather and communicate. It also supports popular database engines (MySQL, Oracle Database, PostgreSQL, etc.), flat message structures, hierarchical sub-forums, user groups, full-text search, plugins, and email notifications.

This article assumes you have at least basic knowledge of Linux, know how to use the shell, and most importantly, you host your site on your own VPS. The installation is quite simple and assumes you are running in the root account, if not you may need to add `?sudo?` to the commands to get root privileges. I will show you through the step-by-step installation of phpBB on Ubuntu 20.04 (Focal Fossa). You can follow the same instructions for Ubuntu 18.04, 16.04, and any other Debian-based distribution like Linux Mint.

- [How to play games with Itch.io on Linux](#) [8]

Itch.io is a website that allows independent developers to host, sell and distribute their video games. It is widely known for helping get indie games off the ground. Here's how to play games with Itch.io on Linux!

[Get healthy reminders on the Linux desktop using Stretchly](#) [9]

Stretchly is an app that you can install on the Linux desktop to remind you to stand up, stretch and relax while working. In this guide, we'll show you how to install Stretchly and how to use it too.
