GIMP 2.10.28 is here more than five months after the GIMP 2.10.24 release, which probably most of you are using on your GNU/Linux distributions right now, to address various bugs and issues, as well as to improve the performance of the application and add some new functionality.

Highlights of this release include a new Script-Fu function called dir-make that lets users create directories from scripts, fixes to various accessibility issues in themes, such as mouse-hover feedback or problematic colors, as well as bug fixes for the BMP, C-source, DDS, DICOM, GIF, Gimpressionist, Metadata Viewer, PS, PSD, Sunras, and TIFF plugins.
