Samba 4.15 is now available as the latest release for improving Windows interoperability (i.e. SMB/CIFS) on Linux and other platforms.

Samba is an open source software which provide print and seamless file services to SMB/CIFS protocol clients. It allows interoperability between Linux/Unix servers and Windows based clients. The software is based on the common client/server protocol of Server Message Block (SMB) and Common Internet File System (CIFS).

To put it simple, Samba can help Windows and Linux/Unix machines coexist in the same network. It allows files to be shared across Windows and Linux/Unix systems simply and easily.
