There are many problems caused by the enforcement of patents in the software industry, but it is important to first understand how user and developer freedoms are affected. If you don't know what End Software Patents (ESP) is about, please read the recent article we posted on the issue of software patents. To support the continued fight against software patents, we are happy to announce that the ESP campaign pages have been completely revamped! In this brief post, we will go over the main changes that you should know about.

ESP has been active for many years, campaigning and influencing public policies around the world. The campaign has been extremely influential, and has become known as one of the most popular global campaigns against software patents, especially after publishing Patent Absurdity, a documentary that demonstrated the severity of the issue. So far,
it has been able to influence important court rulings and policy decisions on software patents in a positive direction. However, a major challenge that ESP had to face was to attract people who were not familiar with the legal aspects of software. The main target audience consisted mainly of developers, lawyers, and people related to the software industry. But this wasn't optimal, because software patents ultimately affect every single software user.
