There is no reason why MX Linux 21, the newest version of yet another of Linux's seemingly infinite number of community-based operating systems, should be this well done. This is, after all, a mostly volunteer operation, just like all the other of Linux's seemingly infinite number of community-based operating systems.

But it is that well done.

That MX 21, codenamed Wildflower, is such a joy to use speaks volumes about Linux and its potential on the desktop, the dedication of its users, and why so many of us never want to boot a Big Tech operating system ever again. It's not so much that MX 21 just works, but that its developers have made a serious effort to identify what would make it work even better.
