Designers and website developers may sometimes need to check WCAG color contrast to make web content more accessible to people with disabilities.

Without using an online website each time, Linux has a stylish GTK4 app ?Contrast? which allows to check whether the contrast between two colors meet the WCAG requirements.

The app has a simple user interface that displays one color as background and another as font color of the text. By clicking on the double arrow icon between two color codes, it reverses background color as text font and font color as background.
