EuroLinux 8.5 is the first minor release created in a continuous way. It was also the first version when we deployed our engineer to remote sites (in most cases virtual) to provide support for organisations that rebuild RHEL/EuroLinux from sources with Gaia build system. This version code name is Tirana - the capital city of Albania.

Below you can find the essential changes in EuroLinux 8.5 release for x86_64 architecture. The aarch64 GA release is slightly delayed. Release notes for aarch64 will be provided in a separate document.
