In November 2021, the Xfce developers managed to update the Whisker Menu plugin that provides an alternate menu for the Xfce desktop environment up to version 2.7.0. Whisker Menu 2.6.2 was released on mid-November to properly prevent interactive search in the treview, as well as to fix menu toggling after pressing the Esc key and background shifting when showing the menu.

Whisker Menu 2.7.0 was released later in November with lots of goodies, including support for rounded profile picture, the ability to show categories as icons on top or bottom, optional AccountsService support, Catfish search action, support for CSS classes for theming, improved search result relevance.
