Fly Pie is a GNOME Shell launcher (available as an extension) designed for users who have one hand on the mouse most of the time. It can be used to launch applications, URLs, recent files, simulate hotkeys, access the clipboard, and more. It works under both X11 and Wayland.

With Fly Pie, you use a keyboard shortcut to open a menu, then use the mouse to do the rest. Once you open a menu, there are three alternative selection modes: point and click (select an item by clicking on it), marking mode (select items by drawing gestures) and turbo mode (draw gestures while holding Ctrl, Shift or Alt without having to press your mouse button).
