In 2004, the Boston Red Sox won the World Series. In 2007, Dell, a top computer manufacturer, is introducing pre-installed Ubuntu Linux on its main PC lines. The worlds of baseball and the desktop will never be the same.

In both cases, people worked long and hard to reach the top. In Linux's case, the top is the recognition that it is not just a hobby operating system, and that it is not an operating system that's only for servers. With its arrival on Dell's desktops, Linux has proven that it can compete in the same league with Mac OS and Windows.

This is only the start. I have reason to believe that Hewlett-Packard, Lenovo, and Toshiba will soon be joining Dell in making Linux easily available for desktop users.

Some of you may be thinking, "Why is this such a big deal?"

Also:

In February when Dell launched IdeaStorm as forum for customers to contribute ideas for product offerings, we received overwhelming feedback that customers wanted Linux on desktops and notebooks.

As part of an overall effort to update our Linux program, today we are announcing a partnership with Canonical to offer Ubuntu on select consumer desktop and notebook products.

In this video, Canonical founder Mark Shuttleworth talks about why he started Ubuntu, Linux adoption rate trends, how previous barriers to Linux adoption for mainstream users are improving, and more.
