Today Ubuntu is not considered the premiere choice for Linux gaming. Users increasingly turn to rolling release Linux distros like Arch as they deliver Linux kernel and graphics driver updates more frequently. They also tend to provide easier access to experimental apps and cutting-edge features that assist gaming and/or game streaming.

Ubuntu has tried to counter some of its (relative) deficiencies in the gaming area over the years. We’ve seen developer outreach initiatives, graphic-centric PPAs, and lots of community marketing. However, even this has dried up in recent years.
