Geared for the Linux pro or UNIX administrator, Linux System Administration was written to provide advice to manage a complete range of systems and servers.

The authors were amazed at how many Linux users, for example, could not write a configuration file. Thinking there were many people who might want to learn of the extensive capabilities of Linux as an application platform, they wrote this book.

Linux System Administration is divided into 11 chapters and an appendix. Each chapter is a module in and of itself so that if you want to learn how to accomplish a specific task such as administering Apache, you can jump into chapter 6 and get going without having to muddle through the first five chapters.
