I bet that you’ve read about GNOME 42’s built-in screenshot and screencast feature in the past, but you probably never saw it in action in its full and final state. As such, I wanted you to be the first to see it in action and learn about its capabilities right here on 9to5Linux.

First of all, I want to make it clear that this is not a new app that will replace the GNOME Screenshot utility, but a built-in functionality of GNOME Shell that you can activate in the GNOME 42 desktop environment and later versions via the PrtSc (Print Screen) key on your keyboard.
