SLAX is a modern, lightweight desktop operating system based on Debian GNU/Linux designed to run on a USB stick. It offers all software available on Debian repository and enables you in these years to run LibreOffice or Chromium Browser in just under half a GB memory, with tens of thousands software packages available for both old and modern computers, while any other OS cannot today. That's SLAX and we will discover it on this article.

SLAX is a portable, lightweight computer operating system from Czech Republic. It is based on Debian GNU/Linux and prior to version 9, Slackware. It is developed as a hobby project for more than ten years by one person, Tomas Matejicek, and independently funded by donation via Patreon and its computer shop.
