If you are a professional Linux user then you might already know that the Nginx and the Apache server both are useful for demonstrating your project under a localhost or a public domain. Before you go to the next stage of the server, you might need to know the difference between the load Nginx balancer server vs the Apache server. The Apache is widely used for or regular user interface to base service for HTTP and HTTPS servers. On the other hand, the Nginx server can handle the server load and balance the traffic of your server.
