The Razer Lambda Tensorbook deep learning laptop is a milestone in pure Linux power

If I've ever experienced a more niche piece of hardware, I cannot recall what it was. The Lambda Tensorbook is niche at its best and I mean that in all positive permutations of the phrase. This laptop is an absolute beast that shrugs off anything you throw at it (especially when you're doing ML training with the GPU). So if machine learning and AI are your jam (and you're willing to pony up the $3,499 for the base model), this laptop is what you want.
It's expensive, it's heavy, and it can get pretty hot, but when you need unrivaled mobile power for ML/AI, you'd be hard-pressed to find a better option.
