If you value privacy and you use a smartphone, you've got a problem. Both Apple and Google constantly collect data on you. A Vanderbilt University study found, for example, that Android sends data to Google even if your phone is sitting idle with Chrome running in the background at a rate of 340 times a day.

Murena and Mandrake Linux founder Gael Duval was sick of it by 2017. He wanted his data to be his data, and he wanted open-source software. Almost five years later, Duval and his co-developers launched the Murena One X2. It's the first high-end Android phone using the open-source /e/OS Android fork to arrive on the market.
