The UBPorts community is in the final stages of preparing its next release and it's calling for testers.

OTA-23 is getting close? the project's Github kanban looks quite good to us? and if you're lucky enough to have one of the project's supported devices lying around, then you can help.

Many of them are a few years old now, so there's a good chance that you've already replaced them and they sit unloved and neglected in a drawer. The starred entries in the list of devices are the best supported and should have no show-stopping problems. In order of seniority, that means: the LG-made Google Nexus 5 (2013); the original Oneplus One (2014); two models of Sony Xperia X, the F5121 and F5122 (2016); and Google's Pixel 3a and 3a XL (2019).

(The Reg FOSS desk suspects that if you have one of those lying around somewhere and aren't tempted, you can probably sell it to some open-sourcy enthusiast who would love to give it a go.)

Not starred but still high on the list are several devices which are listed as "functioning well." This means that they get green ticks across almost all of the feature-list apart from one or two items, such as lacking support for wireless external monitors. To us, this doesn't sound like a deal-breaker. These models include the Xiaomi Mi A2 (2018) and Poco X3 NFC (2020), and the Asus Zenfone Max Pro M1 (2018).
