If you're tuning late into the Dedoimedo show, here's a TL;DR on what's happening. I'd like to be able to move away
from Windows as my primary computing platform for home use. This is easier said than done, because of a long software dependency exclusive to Windows, office and gaming being the prime culprits. My journey is starting now, but could take a good few years to complete. Along the way, I'm migrating my software workloads to Linux. Some programs are native, some aren't. One possible solution: WINE.

WINE, the main reason why we're here. I've already shown you how to run Notepad++ this way. It's an amazing, flexible program, with superb capabilities, and in my opinion, unrivaled by any other program of this nature. The question is then, is it possible to get Notepad++ look & feel in Linux, natively?

Today, I'd like to figure that out. I'm not stranger to text editors, it's just that my experience shows that whatever is out there, the other options aren't as good or friendly as Notepad++. However, I'm always testing and trying new things. I do quite frequently use KWrite, Kate, Geany, and to some extent, Notepadqq. Indeed, it is time to tell you a bit more about the latter.
