Arti 0.5.0 is released: Robustness and API improvements

By Roy Schestowitz
Created 25/06/2022 - 1:45pm

Arti is our ongoing project to create a working embeddable Tor client in Rust. It’s not ready to replace the main Tor implementation in C, but we believe that it’s the future.

Right now, our focus is on making Arti production-quality, by stress-testing the code, hunting for likely bugs, and adding missing features that we know from experience that users will need. We’re going to try not to break backward compatibility too much, but we'll do so when we think it's a good idea.
