- **What’s new in Security for Ubuntu 22.04 LTS?** [5]

Canonical Ubuntu 22.04 LTS is the latest long term support release of Ubuntu, one of the world’s most popular Linux distributions. As a Long Term Support release, Ubuntu 22.04 LTS will be supported for 10 years, receiving both extended security updates and kernel livepatching via an Ubuntu Advantage subscription (which is free for personal use). This continues the benchmark of Ubuntu LTS releases serving as the most secure foundation on which to both develop and deploy Linux applications and services. In this blog post, we take a look at the various security features and enhancements that have gone into this new release since the Ubuntu 20.04 LTS release. For a more detailed examination of some of these features, be sure to check out the previous articles in this series which cover the improvements delivered across each interim release of Ubuntu in the past 2 years between 20.04 LTS and 22.04 LTS.
In March last year, as Big Blue was finishing up the development of the Power10 family of Power Systems machines, we wrote an essay explaining that we wanted IBM i to be a first-class operating system citizen on the four-socket Power E1050 machine, which we finally expect to see launch on July 12 if the rumors are correct.

  Back in May, Big Blue said that it was going to be simplifying the IBM i stack ahead of a move to subscription pricing for systems software as well as hardware that runs it. To do that means zeroing out prices for a slew of things that had price tags on them formerly.

- **Guru: The Finer Points of Exit Points** [8]

  Many years ago, we received a call from an IBM i customer stating that all exit points were gone and the QAUDJRN and receivers were missing. Then the question, ?Do you think we?ve been hacked?? Truth was, the exit points weren?t gone; the associated programs had been de-registered. Conclusion, they had most likely been compromised.
