But GNOME folk didn't know how to do this. They don't know how to do window management properly at all. So they take away the title bar buttons, then they say nobody needs title bars, so they took away title bars and replaced them with pathetic "CSD" which means that action buttons are now above the text to which they are responses. Good move, lads. By the way, every written language ever goes from top to bottom, not the reverse. Some to L to R, some go R to L, some do both (boustrophedon) but they all go top to bottom.

The guys at Xerox PARC and Apple who invented the GUI knew this. The clowns at Red Hat don't.

There are a thousand little examples of this. They are trying to rework the desktop GUI without understanding how it works, and for those of us who do know how it works, and also know of alternative designs these fools have never seen, such as RISC OS, which are far more efficient and linear and effective, it's extremely annoying.
