An Early Look at Fedora Linux 37 on Raspberry Pi 4

Raspberry Pi 4 support in Fedora Linux is not a new thing. Users were able to run the Red Hat-sponsored distribution on the tiny computer, but some key features were missing, such as accelerated graphics, so the Fedora Project never officially supported it.

With the upcoming Fedora Linux 37 release, Raspberry Pi 4 support will get the “official” status due to the implementation of accelerated graphics using the Broadcom V3D graphics driver. Accelerated graphics are provided in Fedora Linux 37 using the V3D GPU for both OpenGL-ES and Vulkan.
