Consecutive openSUSE Tumbleweed snapshots have been rolling out to users each day this week.

Among the few major version releases this week are the 5.19 Linux Kernel and the 5.1 HarfBuzz version, which both arrived in snapshot 20220810.

Snapshot 20220810 also brought tons of other packages. Highlights being discussed about the release of kernel 5.19 point to increased arm support, TCP improvements related to larger IPv6 package sizes, and graphical improvements for Intel and AMD GPUs. The text shaping engine harfbuzz 5.1 fixed regressions in bitmap font rendering, improved support for some Arabic and Hebrew fonts and improved the handling of command line options. The hplip 3.22.6 package added support for several new printers and added support for new distros that were recently released. There were Italian and Serbian translation changes in the gnome-software 42.4 update, which also fixed detail text when it
An update of webkit2gtk3 2.36.6 fixed the handling of touchpad scrolling on GTK4 builds as well as several crashes and rendering issues. Other packages to update in the snapshot were postfix 3.7.2, ModemManager 1.18.10, mutt 2.2.7 and more.
