When Kenneth (aka Wolven) submitted Wolvix Hunter and Cub 1.1.0 to us here at On-Disk.com it was nice to see he had a new release, but I had not expected more than some updates to the existing model. Then, as I did the normal double checking that is done when we prepare to post a new release, I found that this was a serious jump from previous releases based on Slax. The new version is based on Slackware itself and the Linux-Live Scripts. I also noticed a great software management tool called "Gslapt", which makes adding, removing, and updating software extremely easy. This peaked my curiosity so I decided I needed to take a closer look.

Live

Wolvix is a Live distribution, meaning that you put the disc into the computer and turn it on and it will run from just a CD as if it were installed on your computer. It's from this LiveCD that you can install Wolvix or just use it from the CD. Live CD or DVDs run a little slower because optical drives are slower than hard drives. Although this holds true for Wolvix as well, you might find that when Wolvix is running from the LiveCD it's at least as fast, or even faster, than your currently installed operating system.
