I installed Fedora 7 on my new Lenovo 3000 N100 Laptop. It wasn't big deal getting up wireless on this one with WPA support as well as the graphics. Wow?miracle I thought?! Sorry no offense, even I love Fedora. I customized the looks with beryl and some GDM themes, and I was happy with my installation.

Soon I connected my headset to play some cool music?for my surprise, sound was coming from both the internal speakers and headphones at the same time. I Checked around on the web for a while and found a solution on the Ubuntu forum.
