"Linux creator Linus Torvalds said on Wednesday that he's now running an Apple Macintosh as his main desktop, mainly for work reasons, although partly simply because he's a self-described "technology whore"."

"Torvalds, who initially created Linux for the Intel x86 platform, revealed to the Linux Kernel Mailing List in February during a discussion on kernel size reduction that his main desktop machine no longer featured an x86 processor. Hence, Torvalds said, a patch specific to the x86 platform that he was submitting to the list for consideration was totally untested."

"Torvald's response came quickly and succinctly. "My main machine these days is a dual 2GHz G5 (aka PowerPC 970) - it's physically a regular Apple Mac, although it obviously only runs Linux, so I don't think you can call it a Mac any more ;)" he said."
