Fixed crash in search mode when a user double clicks on a directory

Added lyx fulltext plugin

Disabled Help button

Fixed search dialogbox layout

Reload catalogs when user changes excluded dir / files

Use readPathList to expand macro for example (\$HOME) in katdaemon and katcontrol

Fixed mem leak

Synchronized with beagle inotify glut

Fixed compilation with unsermake

Added man fulltext plugin

Added chemical/x-pdb fulltext plugin

Added item in kicker: find menu for kat

Added --searchmode argument

Added DVI fulltext plugin

Allow to use kregexpeditor for editing file exclusion list

Fixed inotify test

Added --wizard argument to launch wizard

Added --onlysystray argument to launch only systray

Fixed mem leak in katclient

Mr. Cappuccio states, "The best part of this project, though, has still to come.

Talking with the developers of Tenor, the context linking environment for KDE, we discovered that Kat could be considered the perfect complement for it, because Kat collects information about the content and metadata of the files.

Therefore we agreed to merge the two project in order to develop a complete search environment (content+context) perfectly and seamlessly integrated in KDE.

In the next releases, you will see a metamorphosis that will completely transform Kat while it gets integrated in KDE.

People don't need a desktop search engine. They need to find what they are searching for. And they will do that without even knowing that they are using Kat."
