As the title states, I've been thinking about the future of Funtoo and wanted to post some of my ideas here, so you can offer feedback. These ideas are pretty complex so take some time to reflect on them.

What does the future of Funtoo hold? Basically, more of a fork, supporting MacOS X and other platforms if we want, while maintaining Gentoo compatibility in all areas possible.

Well, first, let me share some of my ideas for the future of Funtoo/
Gentoo:

1) I'd like to have Funtoo under MacOS X. Not in a prefix configuration. Basically, it would be in a hybrid mode where some packages like gcc, perl, python would be provided by Apple and would be "immutable" (you can't upgrade them) while others can be emerged like normal.

2) I want to have a simpler Linux core system. Everything in a stage3 these days is quite complex. So I would like to rewrite ~250 ebuilds of the core system. I would like to make all "wrappers" optional. Nearly all of the Gentoo-centric features would be in optional packages.

3) I want to start using the 3-clause BSD license for future Funtoo work.
