It has been a long time since GIMP 2.6 came out, the last version of the powerful image manipulation program, launching as a viable alternative to Adobe's offering. With this pedigree, the latest version of GIMP has a lot to live up to, and the three years of development certainly seem to have helped its cause.

There have been a lot of major changes made to the way GIMP works, and the developers have been keen to promote the new single window mode especially. It's been a feature requested by the community for a long time, being able to integrate the dockable toolbars into the main GIMP window. While the floating windows were created originally to emulate the look of Photoshop, they never really worked the same way, and there was plenty of times when we just lost the bars as they suddenly moved off screen during start up.
