Cinnarch is a relatively new distribution on the scene. True to its name, it is based on Arch Linux and uses GNOME 3/Cinnamon as its primary DE. At first I figured that the packaging would be fairly stock, but as it turns out (and as you will see later in this post), there are a few other mild customizations present as well.

I tried this on a live USB using MultiSystem; I did not try the installation. To be honest, this is going to be more of a look at GNOME 3/Cinnamon in general rather than Cinnarch specifically as a distribution, though there may be certain things in the distribution affecting the experience of the DE. Follow the jump to see what it's like.

After the boot menu came a scrolling wall of text typical of a distribution derived from Arch Linux.
