I haven't upgraded to Slackware 14 yet and in a moment of madness obliterated my old install to start all afresh. That leaves some room to try the new release of Absolute Linux first which of course is based on Slackware. So here we go.

As expected Absolute Linux 14.0 is not radically different from 13.1, details of which you can read here. Besides the usual package updates that Slackware itself has undergone as well there isn't a lot to tell on the surface. Underneath Slackware is now using kmod to load modules but that is pretty irrelevant to the desktop user experience. Absolute is still centered around IceWM which is why it was tailored in the first place but also offers Fluxbox as another light weight alternative. It is still 32-bit for the i686 architecture only, in keeping with its target market of older but not too old PC's, i.e. no 486 processors any longer. It is fully compatible with SlackBuilds and Slackware repositories. Like other derivatives it also still uses a slightly modified version of that old ncurses installer, only in gray.
