This is not a competition. The thing is, you can install any which program on any which distribution, pretty much, regardless of what desktop environment you choose to choose. Instead, this is a friendly reality check for people who prefer this or that operating system. Let's say you wish to use only the native applications developed for your particular flavor of the desktop. How would your productivity or efficiency or peace of mind change then?

We will pit Gnome programs vs. KDE software, across a range of categories. No browsers this time, since we did them only a few weeks ago, so you have your plethora of pinia ? I mean browsers to test and compare. Today, we will focus on other applications, like file managers, image and photo software, office suites, media players, and a handful more. I will try to be objective, a near impossible task, and give you an overview when and where the KDE tools take a lead and which Gnome apps you will want to prefer for your daily use. And at no point in the time-space continuum will be debate the merits of the desktop environments as a whole. That's a different subject for a different article.
