Although it has chiefly been known as a desktop Linux distribution, Ubuntu has been gaining ground in data centers as well, according to the latest statistics from web survey outfit W3Techs.

In figures compiled on Thursday, 7 per cent of all the world's web servers were found to be running Ubuntu, up from 5.5 per cent the previous year.

Although that might sound like a mere drop in the bucket, it's actually a very solid showing. By comparison, just 3.4 per cent of web servers were running Red Hat; 1.2 per cent were running Red Hat's community-maintained cousin, Fedora; and a mere 0.8 per cent were running Suse.
