Submitted by srlinuxx on Friday 18th of January 2013 10:07:08 PM Filed under [Linux](#) [1]

Although I have reviewed a number of Fedora remixes, I haven't reviewed proper Fedora since the very first review/comparison test I posted on this blog over 3 years ago. There are, however, a few reasons for me to be trying this out today.

Fedora is typically more for Linux users with intermediate levels of experience and comfort with Linux, as well as for developers and administrators who want to see what is coming in RHEL/CentOS. That said, it can sometimes make a good consumer-grade desktop distribution as well, as long as it is done right; that's why there are so many remixes of it out there.

I tried the live session through a live USB system made with MultiSystem. As the revamped installer is a new feature, I tried the installation as well through a 64-bit Linux Mint 13 LTS "Maya" Xfce live USB system made with MultiSystem as well. Follow the jump to see what it's like.
