Due to Fedora 20 development releases shipping with debug symbols and other non-release-ready code, the tests today were limited to just giving a quick overview of the performance differences between Fedora 20 Beta and Fedora 19. Fedora 19 was tested in both its stock configuration and then installing all available updates. For ruling out some of the performance issues on Fedora 20 Beta due to the debug state, "slub_debug=-" was set as one of the kernel command-line parameters.
