After patiently waiting for Ubuntu to officially announce their 12.04.4 update and once the number of seeders of LXLE grew to an adequate level to 'serve' it, LXLE 12.04.4 has been released.

This particular release builds on the idea that many 'at idle' processes can be replaced by 'on demand' solutions, such as weather, battery, updates, power management, etc. It also introduces microcode kernel updates for your processor and preload, a readahead daemon, by default.
