Manchester's role in the history of computing is not widely recognised. I spent several years working in Manchester Computing and I studied where the first programmable computer was built (by Kilburn, whom the building was later named after). One of my colleagues at Manchester Computing (MCC) was the person who was first to build and distribute a GNU/Linux distribution (combining both GNU and Linux) and yesterday I met and spoke to one of the earlier PC distributors from across the road (supplier for Manchester Computing). Right here at the centre of Manchester a lot of the early milestones of computing took place (Turing also), but Manchester became better known for the splitting of atoms, the football teams, famous bands like Oasis, and the industrial revolution. A few days ago Rianne and I visited the local museum which demonstrates the industrial revolution (photo above from this album); what we really need here, however, are more museums documenting Manchester's role in modern computing. This city deserves more credit.
