Ever since the Raspberry Pi burst onto the scene in 2012, open source hardware projects have been promoting their Linux-ready hacker boards as offering faster, more capable alternatives. Considering the Pi's 700MHz ARM11 processor and relatively modest feature set, that's not such a stretch, but matching the \$35 price is another story. If you can't match the price, what you really need to get the attention of Pi-lovers looking for a bit more oomph is to look and act like a Pi.
