Power is not generally associated with Chromebooks, since they utilize either ARM processors, like tablets, or Intel's Celeron processors. Google's Pixel was the only Chromebook that could be described as powerful because it uses one of Intel's Core i5 processors. However, on Monday we saw an Acer Chromebook that is powered by an Intel Core i3 processor. This is a large jump from the usual low power processors found in most Chromebooks, and will offer that power at a much lower price than the Chromebook Pixel.
