Wayland 1.5 features a new internal event queue for Wayland display events, which allows for the client library to dispatch delete and error events immediately. On the build front, Wayland now uses non-recursive Makefiles.

As usual, the Weston compositor changes tend to be more interesting these days and includes more work on XDG-Shell, the Weston input stack is now split out into libinput, there's support for the new XWayland Server to be found in this summer's release of X.Org Server 1.16, the full-screen shell was added, an animate window closing event, support for different color depths on different outputs, and other changes.
